

ANDAMOOKA

GEOLOGICAL SURVEY OF SOUTH AUSTRALIA
DEPARTMENT OF MINES ADELAIDE

S.A. GEOLOGICAL ATLAS SERIES SHEET H 53-12 ZONE 5

FIRST EDITION 1966

REFERENCE

- Lakes, lake deposits. Gypsiferous clays, silts, quartz sands.
Alluvium, gravels and silts of major drainage channels; outwash flood plain deposits.
Sand ridges and sand spread with claypans.
Sand dunes.
Older system of dunes; quartz sands with kunkur, silicified sand dunes.
Duricrusted Tertiary and older sediments (partially differentiated).
Lake and stream deposits: conglomerates, agate grits, and sandstones.
White and grey kaolinitic siltstones, shales and sandstones with "vitrific" boulders, gravels, grits and conglomerates, particularly near the base and at the margins of the basin. Reworked in Tertiary in part. Apatite fauna (Marnes Formation Equivalent). Formation includes precious opal. Carbonaceous clays, lignite generated in boring (Mirambuccina bore etc.).
Coarse sands, grits, ferruginous sandstones, boulder beds; plant remains rare (Algebuckina Sandstone Equivalent).
- YARRA-WURTA SHALE:** Red-brown, purple, green shales and siltstones.
ANDAMOOKA LIMESTONE: Laminated and massive brown and grey limestones. Archaeocyatha locally common, algal mats developed near northern margin of Lake Torrens. Basal beds include shaly grits and thin boulder beds.
- SHELF FACIES**
YARLOO SHALE: Purple shales.
TENT HILL FORMATION:
ARCOONA QUARTZITE MEMBER: Cross-bedded, red-brown flaggy quartzites and sandstones with shale casts.
White shaly sandstones, purple flaggy siltstones and purple and green shales. Typically cross-bedded and micaceous. Dolomite.
WOOMERA SHALE MEMBER: Finely laminated purple, red-brown and green shales.
- ADELAIDE GEOSYNCLINE**
POUND QUARTZITE: Red-brown thin bedded sandstones and quartzites with shale casts, minor ferruginous gritty sandstones.
WONOKA FORMATION: Yellow and purple flaggy siltstones, green calcareous shales; purple and green siltstones near base.
BLUNYERCO FORMATION: Red and green micaceous shales.
A.B.C. RANGE QUARTZITE: Flaggy red-brown and purple sandstone-quartzites with shale casts.
BRACHINA FORMATION: Green and purple micaceous siltstones.
NUCCAENA FORMATION: Yellow-weathering dolomite, purple shales.
ELATINA FORMATION: Purple and white gritty sandstones, purple siltstones with red granules.
AMBEROONA FORMATION: Green siltstones, yellow-weathering gritty dolomites, calcareous grits and sandstones.
TAPLEY HILL FORMATION: Grey and green laminated siltstones and siltstones, thin yellow-weathering dolomites.
TINDLEPINE SHALE MEMBER: Finely laminated grey shales with red and green laminations.
Sandstones, quartzites with shales, thin grits and pebbles; pebbly quartzites, minor tillite.
Grey-green siltstones.
SKILLOGALEE DOLOMITE EQUIVALENT: Grey dolomites, shales and quartzites with thin magnesian conglomerates.
Grey-green dolomitic siltstones.
WITCHELINA QUARTZITE: Massive and flaggy, well bedded quartzites.
Siltstones and shales with thin quartzites and dolomites.
Limestones, dolomites, siltstones and shales, ripple marked quartzites and carbonate breccia occurring in diapiric structures.
Dolerite plugs.
Ironstone, massive limonite, haematite associated with faulting.
